

# You should get a COVID-19 test if:

- You have new symptoms such as fatigue, headache, body/muscle aches, cough, fever, sore throat, and/or congestion.
- You have symptoms and are at high risk for severe illness because of other medical conditions, age, or have a compromised immune system. You may qualify for treatment to reduce your risk of severe illness.

## Consider getting tested if:

You had a known exposure to someone with COVID 3-5 days ago, especially if you are unvaccinated.

---

## Given how extremely contagious the Omicron variant is, if you have symptoms of COVID-19 and cannot get tested:

- Assume you have COVID-19 and follow isolation guidelines.
- If members of your household are having similar symptoms, and at least one of them tests positive for COVID-19, you can probably assume that all members have COVID-19.

## Do not get a PCR test if:

- You have tested positive in the last 30 days.
- You have already tested positive with a rapid home test.
- You need a negative test to end isolation early (for that, use a rapid home/antigen test).

**Please do not come to the Emergency Room if you ONLY need a COVID-19 test.**
